

AZ-305 Agenda

Module 01 Design a governance solution

Module 02 Design a compute solution

Module 03 Design a non-relational data storage solution

Module 04 Design a data storage solution for relational data

Module 05 Design a data integration solution

Module 06 Design an application architecture solution

Module 07 Design Authentication and Authorization Solutions

Module 08 Design a solution to log and monitor Azure resources

Module 09 Design a network infrastructure solution

Module 10 Design a business continuity solution

Module 11 Design a migration solution 

Design a migration solution

Learning Objectives

- Evaluate migration with the Cloud Adoption Framework
- Describe the Azure Migration Framework
- Assess your workloads
- Compare migration tools
- Migrate your databases
- Select an online storage migration tool
- Select an offline storage migration tool
- Learning recap

Project

AZ-305: Design Infrastructure Solutions
(30-35%)

Design migrations

- Evaluate a migration solution that leverages the Microsoft Cloud Adoption Framework for Azure
- Evaluate on-premises servers, data, and applications for migration
- Recommend a solution for migrating workloads to infrastructure as a service (IaaS) and platform as a service (PaaS)
- Recommend a solution for migrating databases
- Recommend a solution for migrating unstructured data

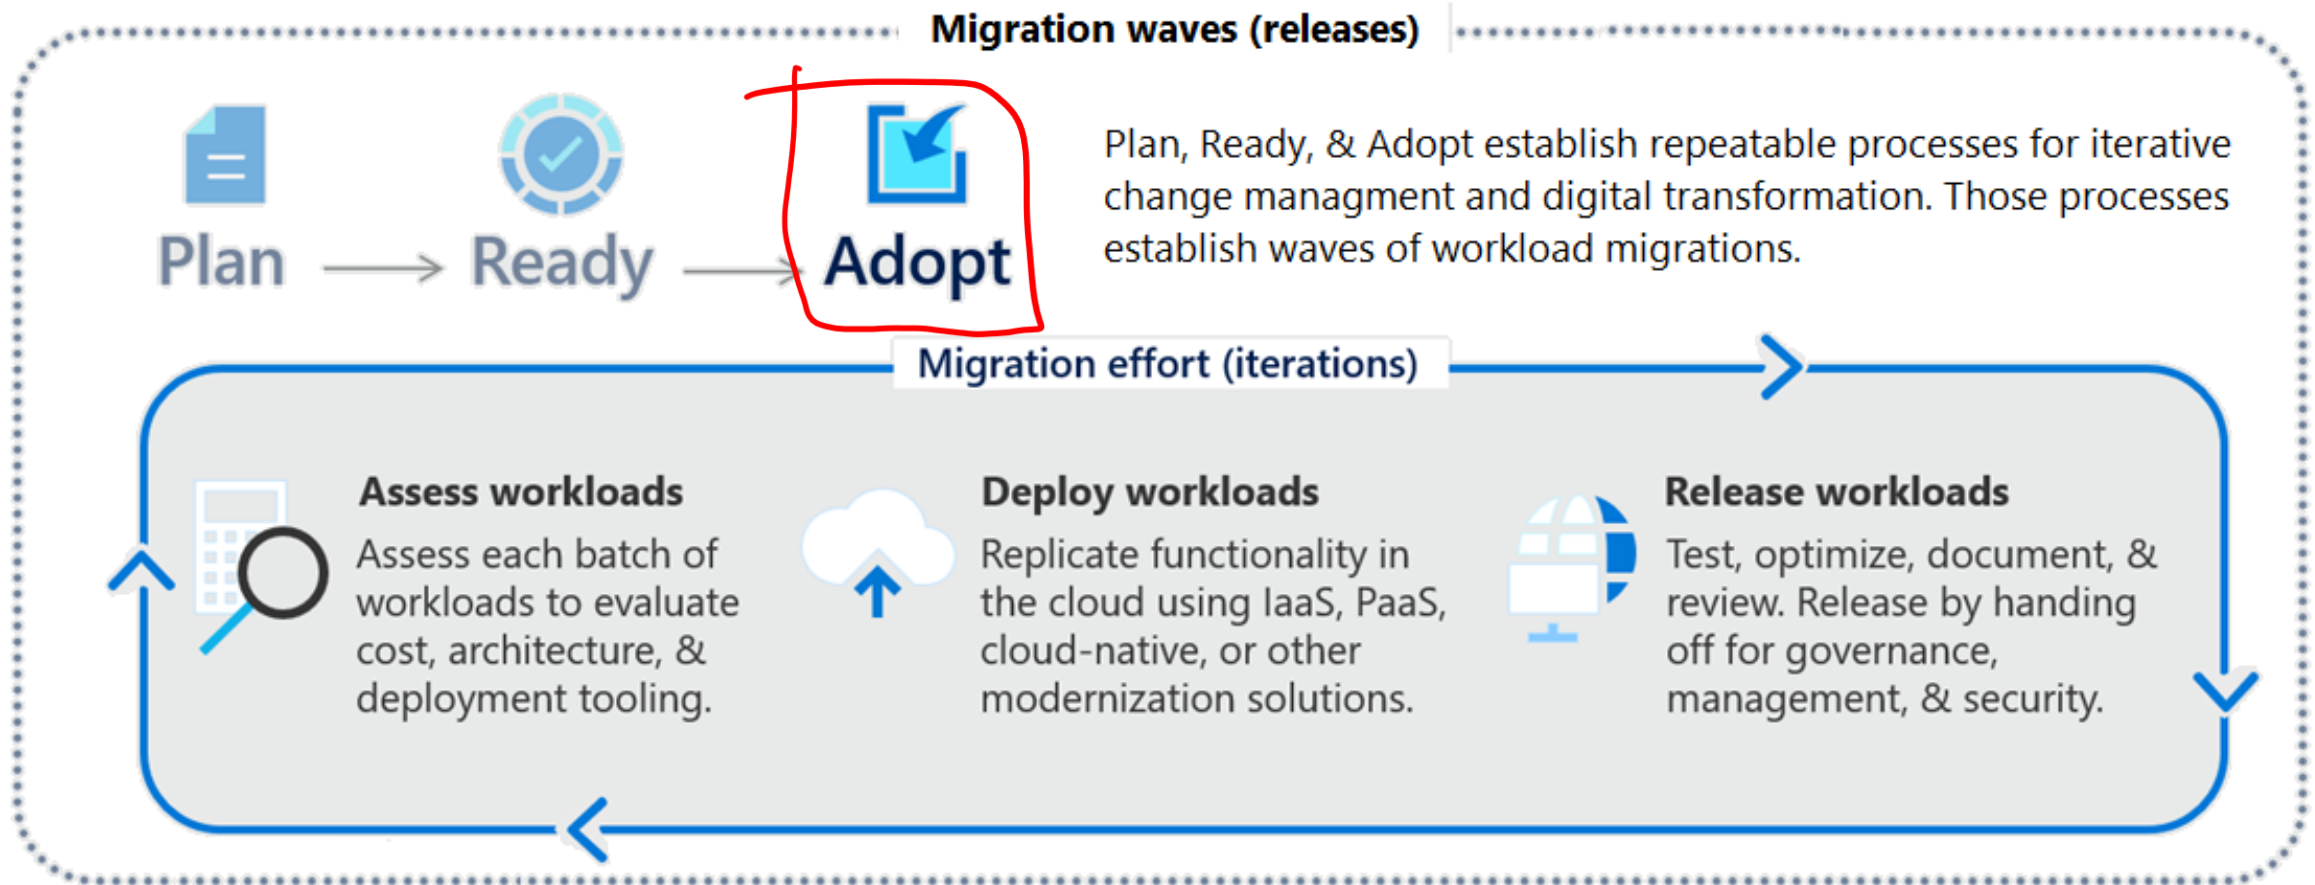

Evaluate migration with the Cloud Adoption Framework

Review the Cloud Adoption Framework CAF

Focus on migration efforts

Describe the Azure Migration Framework

Determine your migration strategy

Select a strategy that meets your goals – you may need several strategies

	Pattern	When to use
	Rehost	<ul style="list-style-type: none">• Move workloads quickly to the cloud• Don't need immediate changes to app capabilities
	Refactor	<ul style="list-style-type: none">• Apply Azure DevOps practices or using a container strategy for workloads.• Consider the portability of your existing code base and available development skills.
	Rearchitect	<ul style="list-style-type: none">• Use existing application investments,• Apps need major revisions for new features and to work effectively on a cloud platform.
	Rebuild (new)	<ul style="list-style-type: none">• Rapid development and existing apps have limited functionality and lifespan.• Expedite business innovation by using Azure DevOps practices.• Legacy apps as no code or low apps in the cloud.

Assess your workloads

Determine what to migrate

Migrate and modernize all your mission-critical workloads to Azure.

Scenario	Description
Windows Server workloads	<ul style="list-style-type: none">On-premises Windows virtual machines (not databases)
SQL Server workloads	<ul style="list-style-type: none">Databases and other functionality running on SQL Server virtual machines
Linux workloads	<ul style="list-style-type: none">RedHat or SUSE VMs, and Hadoop and Linux containers
ASP.NET-PHP-Java apps	<ul style="list-style-type: none">Customer-facing and internal-facing apps at the SaaS level
SAP HANA ? .	<ul style="list-style-type: none">Enterprise resource planning with a centralized database
Specialized compute	<ul style="list-style-type: none">High-performance computing (HPC)

Compare migration tools

Identify migration tools

Tool	Usage
Azure Migrate: Server Assessment ✓	<ul style="list-style-type: none">Physical servers and on-premises VMs running in Hyper-V and VMware environments as preparation for migrating to Azure.
Azure Migrate: Server Migration ✓	<ul style="list-style-type: none">Physical servers and on-premises VMs running in Hyper-V, VMware environments, and other public cloud VMs.
Azure Migrate: <u>Database Assessment</u>	<ul style="list-style-type: none">Performs an assessment of on-premises Microsoft SQL Server databases as preparation for migration to Azure SQL Database, an Azure SQL Managed Instance, or Azure VMs running Microsoft SQL Server.
Azure Migrate: <u>Database Migration</u>	<ul style="list-style-type: none">Migrates data from your existing on-premises databases to databases running in Azure.
Azure Migrate: <u>Web App Assessment</u>	<ul style="list-style-type: none">Assessment of on-premises web apps and migrates them to Azure.
Azure Migrate: Data Box	<ul style="list-style-type: none">Move of large amounts of offline data to Azure by using Azure Data Box.

Migrate your databases

Select a database migration type

Database migrations can be performed offline and online

Migration type	Migration scenario
Offline	<ul style="list-style-type: none">• Requires shutting down the server at the start of the migration.• Application downtime begins when the migration starts.
Online	<ul style="list-style-type: none">• To limit downtime to the time required to cut over to the new environment when the migration completes, use an online migration.• Uses a continuous synchronization of live data, allowing a cutover to the Azure replica database at any time.

Each migration type supports different source and target database pairs

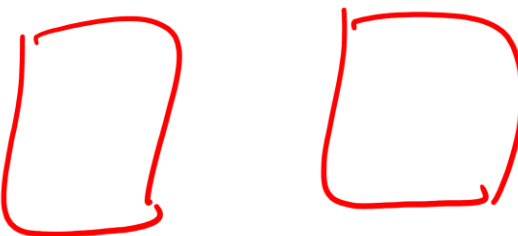

- Check for support of your migration scenario as migration tools are updated frequently

Select an online migration tool

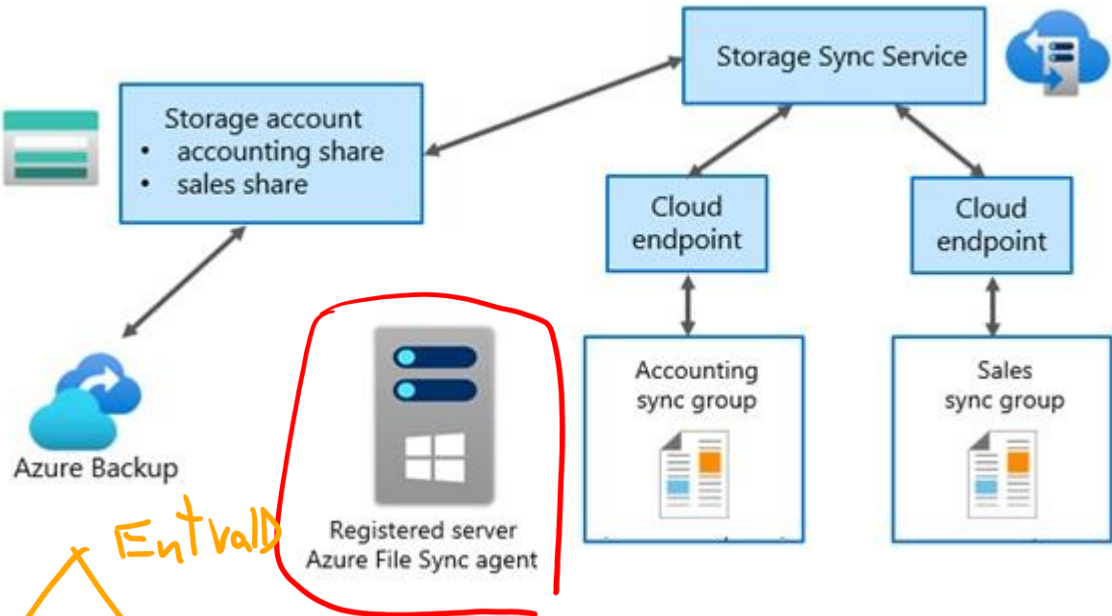

Consider using Azure File Sync

Azure File Sync can be used specifically for migration

 onPrem

- Works in both hybrid and cloud migrations
- Transfers both the data stream and file metadata
- Combines with other products like Azure Data Box
- Supports tiering options

AD  corresponds to FS share perm. / NTFS perm.

entpricht

ISA

Hybrid User

02 Prem

Kerberos Token

ACL

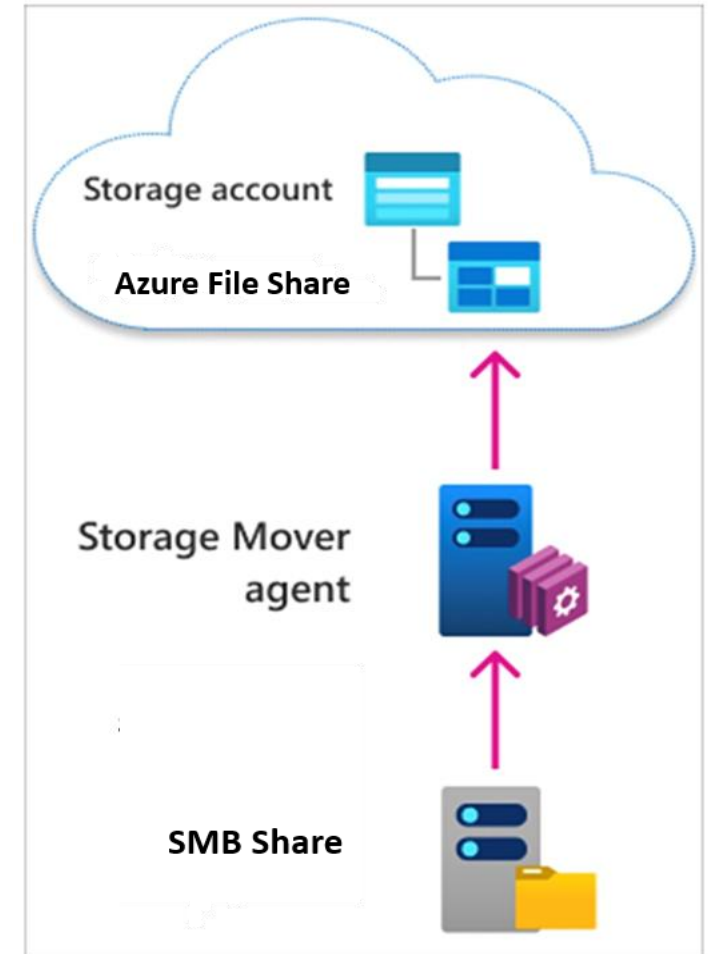

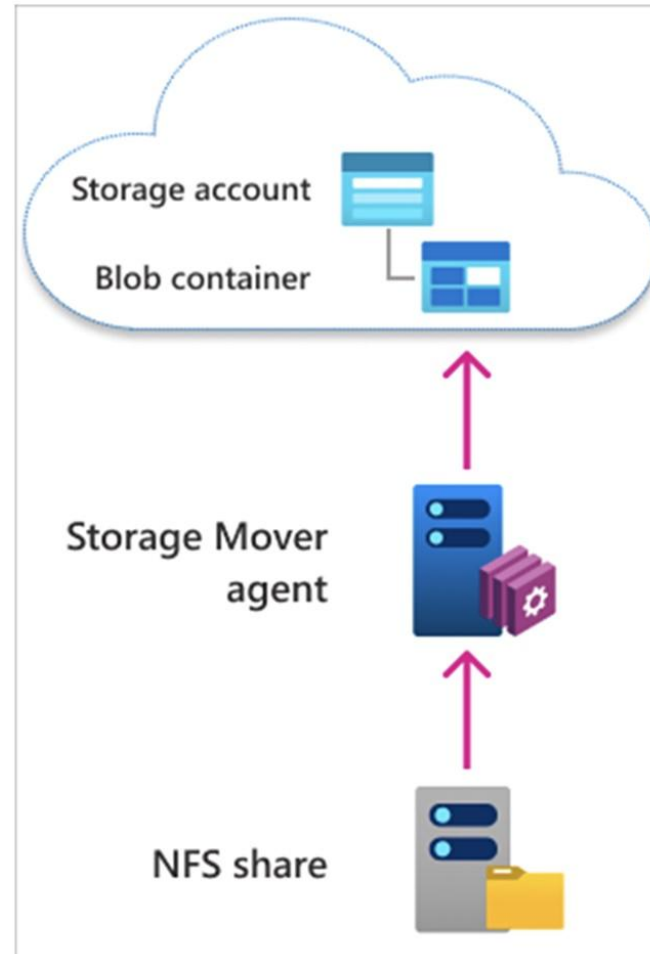

FC

klis tjt

Consider the Azure Storage Mover

Storage migration service for both files and folders

- Works with SMB 2.0 shares
- Works with NFS 3 & 4 shares

Select an offline migration tool

Consider the Import/Export Service

Import/Export migrates on-premises locations and Azure Storage accounts

- Migrate large amounts of your data from on-premises to Azure, as a one-time task
- Back up your data on-premises in Azure Storage
- Recover large amounts of data that you previously stored in Azure Storage
- Distribute data from Azure Storage to customer site

Export data with Azure Import/Export

Import data with Azure Import/Export

Consider the Data Box family of products

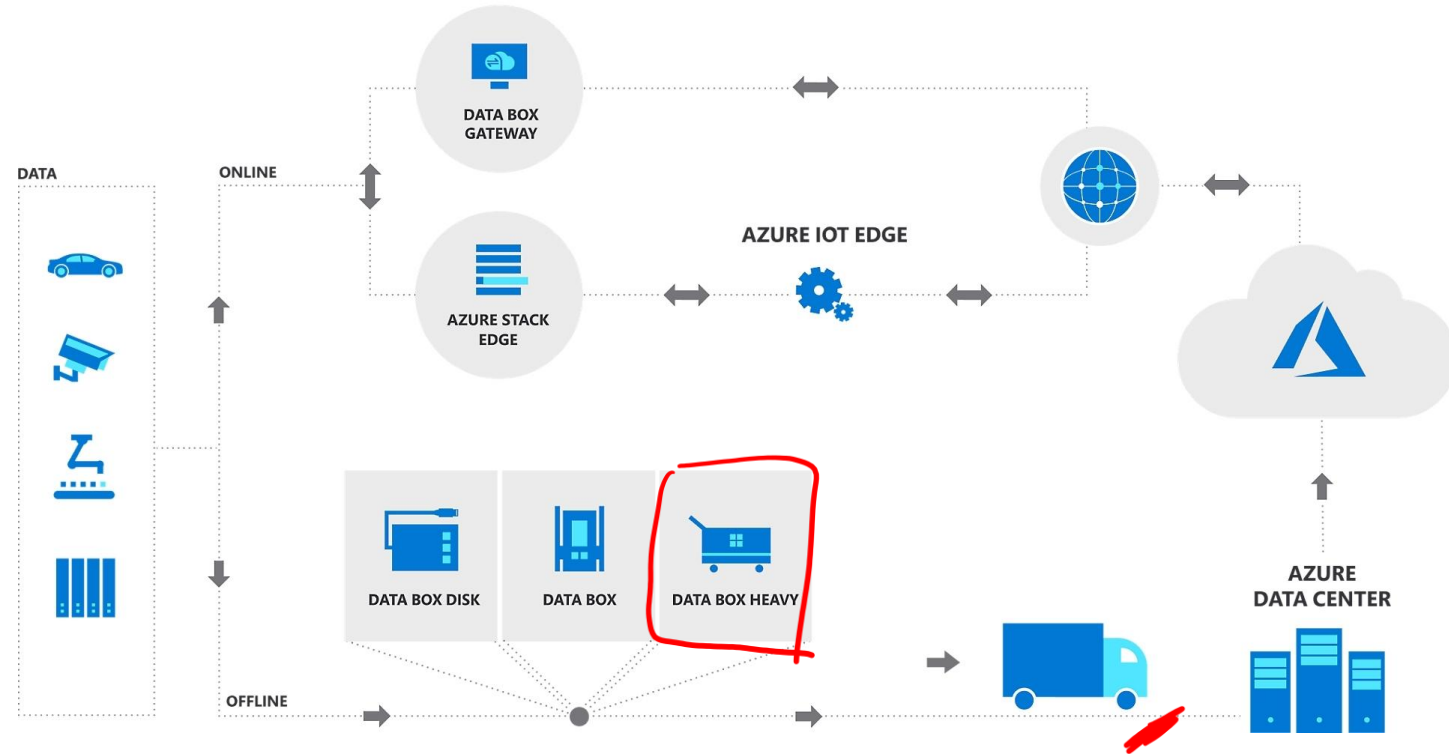

Data Box provides offline and online data transfer.

Scenarios to import data to Azure

- One time migration
- Initial bulk transfer
- Periodic uploads

Scenarios to export data from Azure

- Disaster recovery
- Security requirements
- Migrate back to on-premises or to another cloud service provider

Compare data migration solutions

Dataset	Network bandwidth	Solution to use
Large dataset	Low-bandwidth network or direct connectivity to on-premises storage is limited by organization policies	Azure Import/Export or Data Box for export; Data Box Disk or Data Box for import where supported; otherwise use Azure Import/Export
Large dataset	High-bandwidth network: 1 gigabit per second (Gbps) - 100 Gbps	AZCopy for online transfers; or to import data, Azure Data Factory, Azure Stack Edge, or Azure Data Box Gateway
Large dataset	Moderate-bandwidth network: 100 megabits per second (Mbps) - 1 Gbps	Azure Import/Export or Azure Data Box family where it is supported
Small dataset: a few GBs to a few TBs	Low to moderate-bandwidth network: up to 1 Gbps	If transferring only a few files, use Azure Storage Explorer, Azure portal, AZCopy, or AZ CLI

Review

Discussion (activity)

What strategies or tooling would you suggest for these situations?

- Media and corporate files
- Product catalog that uses a database
- On-premises virtual machines
- On-premises NAS server
- Cloud based blob storage
